

Rishabh Chouhan

rchouhan8@gatech.edu | 678-675-9397 | Atlanta, GA | US Citizen | <https://www.linkedin.com/in/chouhan-rishabh/>

EDUCATION

Georgia Institute of Technology – M.S. Computer Science (4.0 GPA)
Georgia State University – B.S. Computer Science

Aug. 2025 - Present
Aug. 2023 - May 2025

WORK EXPERIENCE

Care Access

AI Solutions Architect

Jul. 2025 - Present

Remote

- Owned the design and delivery of an internal AI and automation platform across operations, marketing, and data, replacing fragmented workflows with scalable systems that support clinical trial recruitment and field execution.
- Automated event lifecycle workflows, recruitment processes, reporting pipelines, and cross-team coordination, eliminating an estimated 150–250+ hours/month of manual operational work.
- Architected cross-system pipelines integrating Monday.com, Slack, Microsoft Graph, Databricks, and Microsoft Fabric, enabling real-time data flow, self-service analytics, and faster operational decision-making.
- Built AI-powered internal tools using LLM workflows, semantic search, and structured extraction, allowing non-technical teams to analyze documents, query data, and generate operational outputs without analyst dependency.
- Led migration from ad-hoc scripts to a structured engineering model with GitHub versioning, CI/CD, environment-scoped secrets, logging, monitoring, and failure recovery for business-critical automations.
- Partnered with VP/SVP-level stakeholders, operations leaders, data teams, and engineering partners to scope high-impact initiatives, align technical tradeoffs, and drive adoption of AI and automation systems.

Reachmind LLC

Founder, Applied AI Systems

Feb. 2024 - Present

Remote

- Built an AI automation engine that ingests documents, prompts, and structured data and generates workflow-ready outputs
- Designed end-to-end pipelines (ingestion → LLM processing → output → delivery) reducing workflows from hours to minutes
- Developed reusable services for content generation, summarization, and extraction, enabling language interaction with workflows
- Operated as sole technical owner across architecture, development, and deployment, optimizing for speed and real-world usability

Kaiser Permanente

Software Engineering Intern

Jun. 2023 - Sep. 2023

Buckhead, GA

- Built a Swift/SwiftUI feature integrating healthcare APIs to surface multi-drug interaction risks in real time
- Designed modular architecture across UI, networking, and data layers for maintainability and scalability
- Developed tests, debugged issues, and contributed within an Agile/Scrum (Jira) environment

SKILLS

Languages: Python, TypeScript, SQL, Swift, Java

LLM Systems: Claude API, OpenAI API, RAG, embeddings, vector search, structured extraction, tool use, agent workflows, eval design

Backend & Infra: FastAPI, Node.js, REST APIs, Docker, queues, CI/CD, serverless, GitHub Actions

Data & Analytics: Databricks, Spark, Microsoft Fabric, Power BI, ETL/ELT, PyTorch, scikit-learn, TensorFlow, time-series, calibration, model evaluation

Cloud & Platforms: Azure, GCP, Supabase, Firebase, PostgreSQL, pgvector

PROJECTS

State-Aware CGM Risk Prediction for Type 1 Diabetes (Research @ CBA Lab under Thomas Plötz)

Aug. 2025 - Present

- Developed a calibration-first research protocol for type 1 diabetes CGM risk prediction, reframing 30- and 60-minute glucose forecasting as state-conditioned risk estimation rather than simple point prediction.
- Designed an evaluation framework comparing CGM-only baselines, engineered patient-state ML models, sequence models, and hybrid multitask models across Brier score, calibration, AUROC/AUPRC, false-alert burden, missed-event rate, and lead time.
- Proposed a staged validation strategy using OhioT1DM for development and ablation, DiaTrend for external validation, and OpenAPS Data Commons for robustness testing under real-world distribution shift.

Agent Context Layer — TypeScript, Python, FastAPI, PostgreSQL, pgvector, Claude API

May 2026

- Built a permissioned context layer for AI agents inside business, separating retrieval, policy checks, approval routing, execution, and audit logging.
- Implemented mocked enterprise connectors, context packets, human-in-the-loop approvals, and structured traces for every model/tool decision.
- Designed a safe workflow execution system: agents receive scoped context, pass policy gates, and cannot take high-risk actions without approval.

Claude Workflow Safety Evals — Python, Claude API, Pydantic, pytest

May 2026

- Built an evaluation for workflow agents across enterprise scenarios involving email, documents, task systems, restricted data, and external actions.
- Measured permission violations, hallucinated tool calls, missing-context behavior, approval compliance, and unsafe execution attempts.
- Implemented deterministic scorers, mock-safe and unsafe providers, scenario YAMLS, trace logs, and markdown/JSON safety reports.

Image Workflow SaaS — Next.js, Supabase, Stripe, BullMQ, Sharp

May 2026

- Built a queued image-processing SaaS with authentication, billing, private storage, worker-based processing, and admin job monitoring.
- Implemented usage accounting, Stripe webhook idempotency, retry/refund logic, environment validation, and worker failure handling.
- Designed plan-based access control and background processing for production reliability, observability, and abuse-prevention concerns.
